LONG LIFE COMPOUNDS PRODUCE COST SAVINGS OF UP TO 60 % AND A MORE SUSTAINABLE MASS FINISHING OPERATION

CONTENT CREATED BY ROSLER

Cleaning and recycling of the process water along with the use of recycling compounds has pretty much become the standard for mass finishing operations. But a key issue has always been how long the process water lasts before it must be exchanged. With our new Rösler Long Life compounds the usable life of the process water can be practically doubled for most applications. This significant improvement of our proven ZF compounds became possible with an innovative blend of raw materials. It allows us to maintain the excellent performance of our ZF compounds, such as corrosion protection, degreasing/de-oiling or general cleaning, and to increase the process water uptime by nearly 100 %. Besides significant savings in the use of fresh water and waste disposal costs the new compounds also increase the equipment uptime resulting in higher productivity.
